

Project Title	Document Image Analysis
Technologies	Deep Computer Vision (OCR)
Domain	Banking
Project Difficulties level	Basic

Problem Statement:

Documents are an important aspect of many enterprises in a variety of sectors, including law, finance, and technology. Automatic document understanding, such as invoices, contracts, and resumes, is lucrative, offering up a slew of new business opportunities.

Over the last four decades, there has been a lot of research into document image processing and comprehension. Work in the field has been applied in a variety of domains, including office automation, forensics, and digital libraries, and includes preprocessing, physical and logical layout analysis, optical and intelligent character recognition (OCR/ICR), graphics analysis, form processing, signature verification, and writer identification. There are several decent document processing and analysis options available;

The goal of document image analysis is to recognize text and graphics components in images and extract the desired information in the same way as a human would.

The main objective is-

- 1. Process the images of documents like certificates, ID (Driving license, AADHAR Card, PAN Card)
- 2. Extract data at the end and store in a certain format such as JSON, XML, and so on.
- 3. Following figure shows the basic diagram of how an information extraction system should work. Our goal is to extract the key information from the documents.

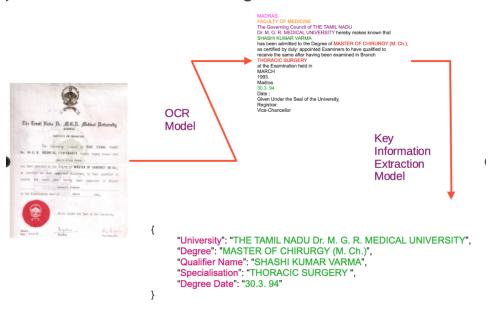

- 4. Create a web portal to submit the document and display the results on the screen.
- 5. Keep an edit option as well on the screen to avoid any mistake done by system.
- 6. Create an API as well.

Dataset:

You have to collect your dataset for this project for the Indian continent, and based on that, you have to design your solution and create a repo for the dataset.

Or use the following dataset to create an initial app - Dataset

Project Evaluation metrics:

Code:

You are supposed to write a code in a modular fashion

- Safe: It can be used without causing harm.
- Testable: It can be tested at the code level.
- Maintainable: It can be maintained, even as your codebase grows.
- Portable: It works the same in every environment (operating system)
- You have to maintain your code on GitHub.
- You have to keep your GitHub repo public so that anyone can check your code.
- Proper readme file you have to maintain for any project development.
- You should include basic workflow and execution of the entire project in the readme file on GitHub
- Follow the coding standards: https://www.python.org/dev/peps/pep-0008/

Database:

- You are supposed to use a given dataset for this project which is a Cassandra database.
- https://astra.dev/ineuron

Cloud:

You can use any cloud platform for this entire solution hosting like AWS, Azure or **GCP**

API Details or User Interface:

 You have to expose your complete solution as an API or try to create a user interface for your model testing. Anything will be fine for us.

Logging:

 Logging is a must for every action performed by your code use the python logging library for this.

Ops Pipeline:

• If possible, you can try to use AI ops pipeline for project delivery Ex. DVC, MLflow , Sagemaker, Azure machine learning studio, Jenkins, Circle CI, Azure DevOps, TFX. Travis CI

Deployment:

• You can host your model in the cloud platform, edge devices, or maybe local, but with a proper justification of your system design.

Solutions Design:

You have to submit complete solution design strategies in HLD and LLD document

System Architecture:

 You have to submit a system architecture design in your wireframe document and architecture document.

Latency for model response:

 You have to measure the response time of your model for a particular input of a dataset.

Optimization of solutions:

- Try to optimize your solution on code level, architecture level and mention all of these things in your final submission.
- Mention your test cases for your project.

Submission requirements:

High-level Document:

You have to create a high-level document design for your project. You can reference the HLD form below the link.

Sample link:

HLD Document Link

Low-level document:

You have to create a Low-level document design for your project; you can refer to the LLD from the below link.

Sample link

LLD Document Link

Architecture: You have to create an Architecture document design for your project; you can refer to the Architecture from the below link.

Sample link

Architecture sample link

Wireframe: You have to create a Wireframe document design for your project; refer to the Wireframe from the below link.

Demo link

Wireframe Document Link

Project code:

You have to submit your code GitHub repo in your dashboard when the final submission of your project.

Demo link

Project code sample link:

Detail project report:

You have to create a detailed project report and submit that document as per the given sample.

Demo link

DPR sample link

Project demo video:

You have to record a project demo video for at least 5 Minutes and submit that link as per the given demo.

Demo link

Project sample link:

The project LinkedIn a post:

You have to post your project detail on LinkedIn and submit that post link in your dashboard in your respective field.

Demo link

Linkedin post sample link:
